Abstract of JP 61116329 (A)

PURPOSE: To easily obtain an image high in responsiveness and wide in visual angle by selectively switching the electrooptic effect of a pi cell with an active switching element. **CONSTITUTION:** The switching element 6 is formed in a matrix on a transparent quartz glass plate 7, and it is combined with another transparent glass plate 2 to form the pi cell liquid crystal panel. The panel is filled with liquid crystals so as to orient them as shown with the arrows 9 in the figure. Polarizing plates 1, 8 are applied to the outside of both glass plates 2, 7 so as to arrange their absorption axes 10 at a 45 deg. to the orientation direction of the liquid crystals.
